

1. The language I selected to research is Python3. I selected it because it is relevant to this course and was the popular choice on the wiki. Its syntax is simple and easy to read, which makes it very accessible for beginners as opposed to languages like Java and C++. It also has a widespread, established user base, so issues are documented and easy to troubleshoot. Python3 is prevalent in a lot of fields like data science and web development, so it is a worthy skill to master in and outside of the classroom.

2. Some tools for working with Python3 are:

VS code, an IDE that I am familiar with from working with HTML in previous classes.

PyCharm, another free IDE that is new to me and strictly made for Python; I am using it for this class.

3. Coding conventions are unofficial “rules” that attempt to create a standard structure for a specific programming language. Some of these guidelines have to do with indentation, comments, and statements and aim to keep code readable and easy to edit and maintain. I chose to research PEP 8. Some of PEP 8s guidelines are:

Every line of code must not exceed 79 characters so lines do not wrap

4 spaces per indentation, on every level
